Of the total U.S. population about 1 in 9 people (10.7%) age 65 and older has Alzheimer's dementia, California having the largest population.

As pioneers in residential memory care, we have encountered many of the challenges faced by family caregivers. Let us help guide your journey, provide support, and offer resources.

Alzheimer's is the most common form of dementia, but not the only one.

Dementia is commonly used as a general term for memory loss and a decline in other cognitive abilities serious enough to interfere with daily life and independent function. Many people have trouble with memory, this does not mean they have Alzheimer's. There are 100 forms of dementia, but about 98% fall within four main categories. **It's important to remember that if you've met one person with dementia, then you've only met one person with dementia.**

Different symptoms require different approaches of care. As memory care experts, our teams are trained on the various aspects of memory care and know how to respond appropriately to the various needs our residents may have. The most common types of dementia include:

- **Alzheimer's disease**
- **Lewy body disease (LBD)**
- **Frontotemporal dementia (FTD)**
- **Vascular Dementia**

Doctors typically diagnose the various types of dementia based on a detailed medical history, physical examination, laboratory tests, and other characteristic changes in thinking and behavior associated with each type.

Memory care requires specialized attention and care. Because it is our main focus, we are able to expertly care for people with all forms of dementia, through all stages.
